

BranchManager embedded technology from *IT-QBase*
for IBM® Rational® DOORS®

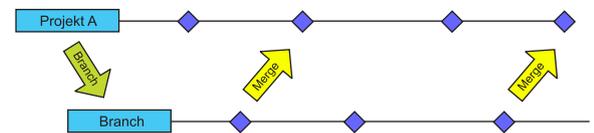

True branch management made easy...

- Branch DOORS projects
- Configurable compare of DOORS formal modules
- Interactive merge of formal modules across branches

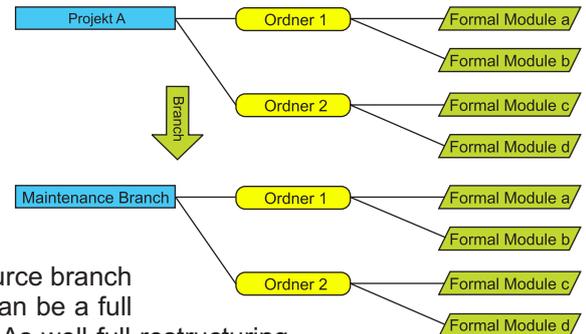

Requirements development and management is a critical part of any business. Having the necessary methods and tools to manage your product requirements is a characteristic of successful organizations developing successful products.

IBM Rational DOORS has demonstrated over the years to be a critical component in supporting organizations developing high quality product requirements.

Branch

BranchManager for DOORS supports multiple branches of an entire project structure in DOORS, maintaining relationships (links and link modules) between the full hierarchy of DOORS modules. Individual requirement identity is maintained across all branches allowing you to view branch history across all source and children branches, as well as merge across the branches.

Branches replicate the entire structure from the source branch to the target branch. When branching, the target can be a full branch of all modules or a subset of the modules. As well full restructuring of the branch is enabled while maintaining branch relationships and history.

- Modifikation / Deletion / Addition
- Textual Attributes
- OLE Attributes
- Images
- DOORS Tables
- Link Changes
- Object Movement

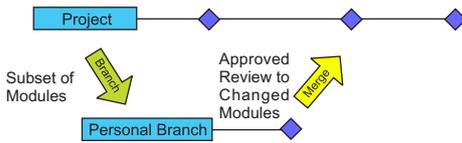

Compare

BranchManager for DOORS provides a powerful comparison mechanism to identify differences between baselines and across branches. Its intelligent comparison engine can compare based on a selectable list of attributes, and can detect changes in attributes, OLE objects, links, and structural changes such as moving a requirement in the hierarchy.

Comparison with HighLevelRequirements current	ID	Requirement Text												
	1	1 General Functionality												
	6	The objective for the home alarm system is to provide the basic building blocks of a system to create a family of alarm systems that meet the needs of residential customers and basic commercial customers. Included in this is the ability to monitor sensor that can both arm and alarm the system.												
	8	1.1 Basic Controller												
	9	1.2 User Interface												
	44	User Interface Options												
		<table border="1"> <thead> <tr> <th>Display</th> <th>Keypad</th> <th>Alphanun Touchscreen</th> </tr> </thead> <tbody> <tr> <td>Basic</td> <td>x</td> <td>x</td> </tr> <tr> <td>Small Color</td> <td>x</td> <td>x</td> </tr> <tr> <td>Large Color</td> <td></td> <td>x</td> </tr> </tbody> </table>	Display	Keypad	Alphanun Touchscreen	Basic	x	x	Small Color	x	x	Large Color		x
Display	Keypad	Alphanun Touchscreen												
Basic	x	x												
Small Color	x	x												
Large Color		x												
	10	1.3 Sensor Network												
	45	The sensor network shall be a wireless system.												
	11	1.4 Sensor Types												
	21	1.4.1 Door Monitor												
	24	The system shall have a sensor to detect the status of the door.												
	25	The allowable status of the door shall be either 'open' or 'closed'.												
	22	1.4.2 Window Monitor												
	26	The system shall support multiple sensors to detect the status of a window.												
	27	The system shall have a window status of either 'open' or 'closed'.												

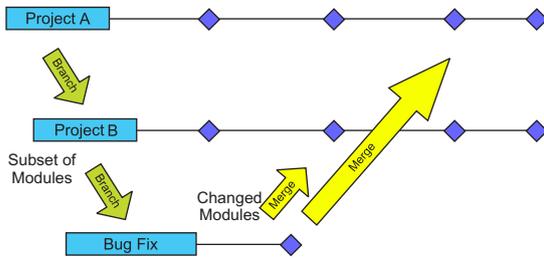

Merge

BranchManager for DOORS enables merging across branches by detecting changes in content, structure, and location of the same objects. Merging is performed using a three-way-merge leveraging a common base. The common base is either the common parent from the branch or a specified previous integration point of the two branches. Non-conflicting changes (no changes to the same object in two branches) can be automatically merged. Conflicting changes require the user to guide the merged result.

Requirements Review

Reviewing proposed requirement changes becomes significantly easier. By flagging the differences between the existing requirements and the proposals on a branch enables offline changes and comparison to the latest requirements. If the proposal is for multiple ranches these can all be reviewed at exactly the same time.

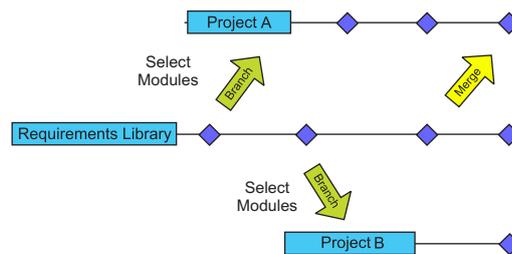

Fix and Propagate

When you have multiple products, it is a common occurrence to identify a requirement that needs to be updated in all products. Instead of doing this by hand, it is much more effective to make this change once and replicate to the other branches.

Core Requirements Reuse

Most organizations have a core set of behaviors that apply to all products, even those that are unique for a particular customer. These requirements are standard and must be applied to all products. These requirements are updated occasionally and therefore need a method to detect and propagate these changes.

Rather than do a simple copy, branching these requirements ensures that updates are merged correctly and consistently

The BranchManager f0r DOORS Suite ...

... built flexibly to meet your organization's demands with these critical capabilities of requirements branching, requirements comparison, and requirements merging.

The BranchManager is fully compatibel with DOORS 8.2 till 9.6. (for 32-Bit as well as 64-Bit)
